

# SAT MATH FORMULAS SHEET

## Linear equations

|                      |                                                                                     |
|----------------------|-------------------------------------------------------------------------------------|
| Slope-intercept form | $y = mx + b$<br>where slope = m<br>y-intercept = b                                  |
| Point-slope form     | $y - y_1 = m(x - x_1)$<br>where slope = m<br>point on line $(x_1, y_1)$             |
| Standard form        | $ax + by = c$<br>where slope = $-a/b$<br>y-intercept = $c/b$<br>x-intercept = $c/a$ |
| Slope                | $m = \frac{y_2 - y_1}{x_2 - x_1}$                                                   |

## Exponents / Radicals

|                      |                             |
|----------------------|-----------------------------|
| $x^a x^b$            | $x^{a+b}$                   |
| $\frac{x^a}{x^b}$    | $x^{a-b}$                   |
| $(x^a)^b$            | $x^{ab}$                    |
| $(xy)^a$             | $x^a y^a$                   |
| $x^{-a}$             | $\frac{1}{x^a}$             |
| $x^0$                | 1 (if $x \neq 0$ )          |
| $x^{\frac{a}{b}}$    | $\sqrt[b]{x^a}$             |
| $\sqrt{xy}$          | $\sqrt{x} \sqrt{y}$         |
| $\sqrt{\frac{x}{y}}$ | $\frac{\sqrt{x}}{\sqrt{y}}$ |

## Trigonometry

|                                 |                                    |
|---------------------------------|------------------------------------|
| $\sin \alpha$                   | Opposite/Hypotenuse                |
| $\cos \alpha$                   | Adjacent/Hypotenuse                |
| $\tan \alpha$                   | Opposite/Adjacent                  |
| $\sin(90 - \alpha)$             | $\cos \alpha$                      |
| $\cos(90 - \alpha)$             | $\sin \alpha$                      |
| $\sin^2 \alpha + \cos^2 \alpha$ | 1                                  |
| 30° to radians                  | $30^\circ = \frac{\pi}{6}$ radians |
| 45° to radians                  | $45^\circ = \frac{\pi}{4}$ radians |
| Common Pythagorean triples      | 3-4-5<br>6-8-10<br>5-12-13         |

## Quadratics

|                                      |                                                                 |
|--------------------------------------|-----------------------------------------------------------------|
| Factored Form                        | $y = a(x - p)(x - q)$                                           |
| x-intercepts                         | $x = p$ or $x = q$                                              |
| Vertex                               | $x = (p + q)/2$                                                 |
| Vertex Form                          | $y = a(x - h)^2 + k$                                            |
| Vertex                               | $(h, k)$                                                        |
| Standard Form                        | $y = ax^2 + bx + c$                                             |
| Vertex                               | $x = \frac{-b}{2a}$                                             |
| x-intercepts                         | 1) Try factoring<br>2) $x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$ |
| When are there 2 real x-intercepts?  | $b^2 - 4ac > 0$                                                 |
| When is there 1 real x-intercept?    | $b^2 - 4ac = 0$                                                 |
| When are there no real x-intercepts? | $b^2 - 4ac < 0$                                                 |

## Miscellaneous

|                                          |                                                                                        |
|------------------------------------------|----------------------------------------------------------------------------------------|
| Complex number                           | $i^2 = -1$<br>or<br>$i = \sqrt{-1}$                                                    |
| Average or arithmetic mean               | sum / number of values                                                                 |
| Relationship of distance, rate, and time | $d = rt$<br>where distance = d<br>rate = r<br>time = t                                 |
| Standard Form of the equation of circle  | $(x - h)^2 + (y - k)^2 = r^2$<br>where $(h, k)$ center of the circle and $r$ is radius |
| Area of circle                           | $A = \pi r^2$                                                                          |
| Circumference of circle                  | $C = 2\pi r$                                                                           |
| Arc length                               | $\frac{\alpha}{360} 2\pi r$                                                            |
| Sector area                              | $\frac{\alpha}{360} \pi r^2$                                                           |
| Distance                                 | $\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$                                                 |
